

STEM Egypt Hack Club's Hub

The project is like a programmers' hub for all STEM Egypt Hack Club members and mentors through the years. Of course, I couldn't put the data about all the members because I won't be able to reach all the past members, and I won't have time to write the code that shows all the members' data. However, I chose two mentors and three members, including me, to write about in the application as a sample. I chose information everyone knows about them to avoid bothering them and also got their permission first.

At first, I edited the project made as the first task in the track to be the home page of the application. I added some text and a text button that moves the user to the next page. After that, I created the second page which contains text buttons that lead to members' accounts (I wanted to make a list view instead, but something didn't work in the code. So, I made text buttons as plan B). At last, I wrote the code of each member's account and put in it three things: image, name, phone number, and experience.

The goal of the application is allowing the communication between all the members through the years and giving information about them.

Recommendation for anyone who is going to work again on this project is to make a feature that allows the members to chat with each other and to make a scoring system for the members to allow the mentors to track the members performance.
